A Level Computer Science

Programming GUI in Python

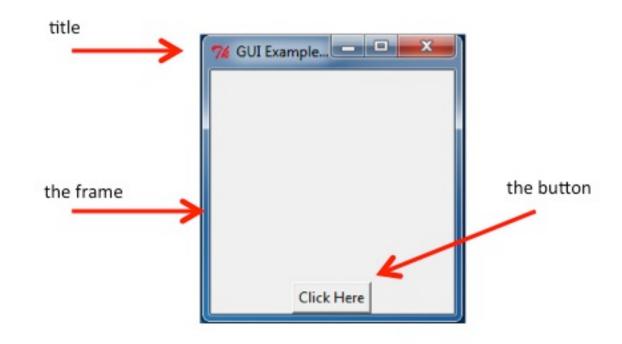

William Marsh School of Electronic Engineering and Computer Science Queen Mary University of London

Outline

- A first program
- Concepts in Graphical User Interface
 - Components / widgets and attributes
 - Events / actions
 - Layout
- Practical examples
- Challenges of GUI programming
 - Choosing a GUI library
 - Using Object-Oriented programming

First Program – Click the Button

- Code provided but not yet explained
- Use 'pattern matching' (i.e. intelligent guessing) to modify it

Practical – Exercise 1 only

When you complete exercise 1, please help someone nearby

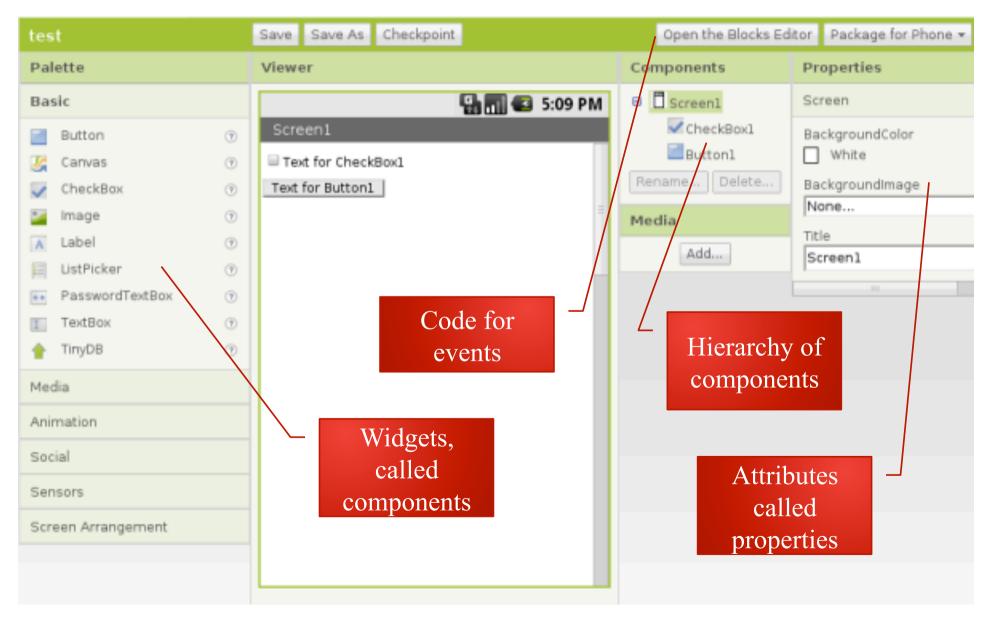

Key Concepts

Explained Using the Button Example

Key Concepts

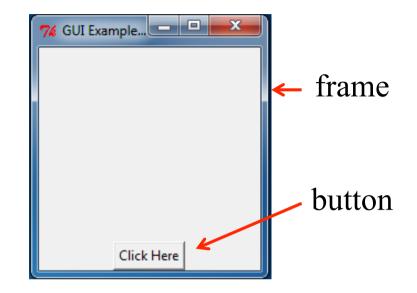

- A widget / component
 - E.g. a button, a frame
 - Attributes e.g. the button text
- Actions
 - E.g. what happens when you press the button
- Layout
 - Positioning widgets

AppInventor

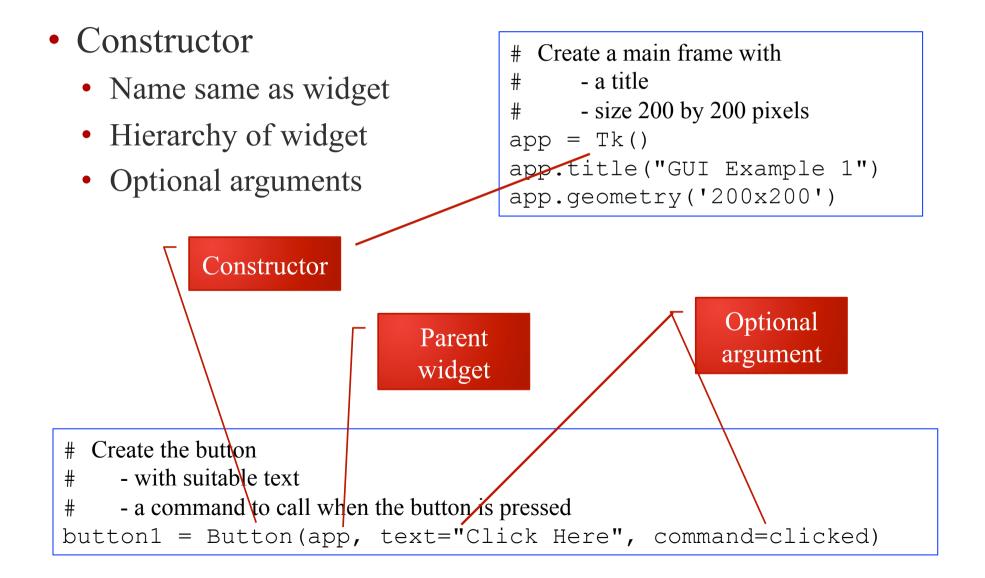

Widgets

- A GUI is made up from widgets
- A widget is created
- Widget has attributes
- One widget may contain another:
 - Frame contains the button

Create a Widget

Widgets have Attributes

- E.g. a name, size
- Any property of the widget that makes it specific

```
# Create a main frame with
# - a title
# - size 200 by 200 pixels
app = Tk()
app.title("GUI Example 1")
app.geometry('200x200')
```

Attributes set by constructor (note use of keyword arguments)

Methods to set attributes

Create the button

#

- with suitable text

- a command to call when the button is pressed

button1 = Button(app, text="Click Here", command=clicked)

How to Set / Get an Attribute

- Method 1 (setting):
 - Set value with the constructor
- Method 2 (setting and getting):
 - Widget is a dictionary

```
# Change button text
mText = button1['text']
button1['text'] = mText.upper()
```

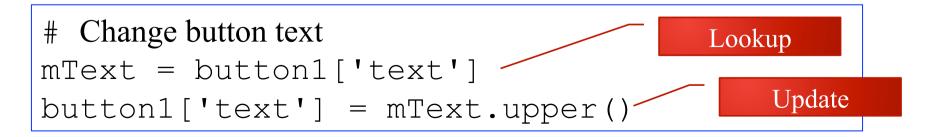

- Method 3 (sometimes)
 - Call a suitable method

Other methods exist

Aside: Dictionaries

- Dictionary: a map from a key to a value
 - Unique key
 - Built in (Python) versus library (many other languages)

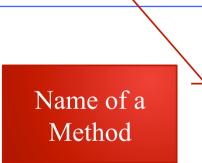

Standard Array	Python Dictionary
Index by number	Key can be a string, pair,
Indices continuous e.g. $0 \rightarrow 10$	Gaps ok
Holds only number, character	Any value – even a dictionary

Handle an Event

This method is called when the button is pressed def clicked(): print("Clicked")

- # Create the button with
 # a command to call when the button is pressed
 button1 = Button(app, text="Click Here", command=clicked)
 - Events
 - Button, mouse click, key press
 - Action
 - Event 'bound' to function

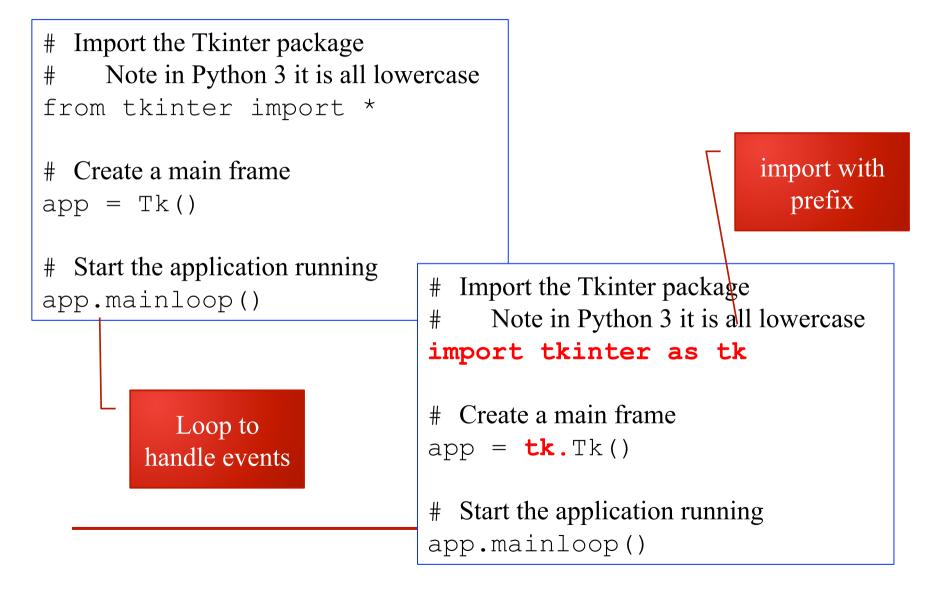

Layout the Widget

Make the button visible at the bottom of the frame
button1.pack(side='bottom')

- Where does the widget go?
 - Hierarchy
 - Top-level window
- Layout manager
 - Several available
 - Problem of resizing
- The 'pack' layout manager is simplest
- Widget is not visible until packed

A Minimal Application

(Some) tkinter Widgets

Widget	Use
Button	A button
Canvas	For drawing graphics
Entry	Entry a line of text
Frame	A rectangular area containing other widgets
Label	Display a single line of text
Menu	A set of options shown when on a menu bar
Radiobutton	Select one of a number of choices
Scrollbar	Horizontal or vertical scrolling of a window
Text	A multi-line text entry
Toplevel	A top-level frame

Further Practical Exercises

See practical sheet

- A sequence of exercises introduce other widgets and apply the core concepts
- Answers included
- ... probably too many to finish now

Further Concepts

- Dialog
- Top-level window
- Control variables

Dialogs

- You must respond to a dialog
 - Messages
 - File choosing

ΣS

No file open

7 No file

Top-Level Windows

- At least one top-level window
 - Conveniently created using Tk()
 - Like a frame but ...
- Menu bar
- Standard buttons
- Borders

Control Variables

- Variables linking ...
 - Entry widget to its text
 - Choices in a RadioButton
- These are objects in the framework

Challenges in GUI

- Which framework?
- *How to design a GUI*
- *How much OOP?*

GUI Framework

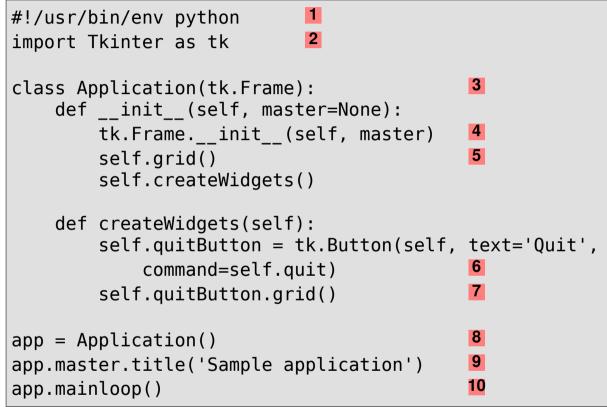

- A GUI framework defines a set of widgets
 - Windows has it's own GUI framework
- Python uses a portable GUI framework
 - tkinter, depends on Tk and TCL
 - PyQT, depends on QT
- Tkinter
 - Pro: simple, easy to install
 - Cons: a bit limited; documentation weak
- PyQT: more complex

Designing a GUI

- What am I trying to do?
- What widgets do I need?
 - Where will they go?
 - How do they behave?

The OOP Problem

- Why OO and GUI
 - Widgets are classes
 - Default behaviour
- GUI programs are often organised using classes

• Practical Problem: most examples use OOP

Summary

- Core concepts common to all framework
- <u>Understand</u> principles
- Learn about available widgets
- <u>Look up</u> attributes and methods
- After programming ... interface design
